

BROKEN PROMISES

ALOBAR...

ALOBAR . . .
Killed in a brain mapping experiment.

BROKEN PROMISES

to people

Most people are unaware that animals are used in spinal cord research in Canada and the United States in an attempt to understand physiological mechanisms and to test surgical procedures and drugs. These experiments cause pain and suffering to animals and, because of the major anatomical and biological differences between species, the misleading results of the experiments harm people, waste research funds and raise false hopes.

The photographs of animals in this brochure were obtained during a Lifeforce investigation of U.C.L.A.'s research laboratories in 1985/86. (The callous attitude of the vivisectors was expressed in the names they used for the crippled animals.)

(1) Chloe's kittens. (2) One of Chloe's kittens learning to walk. (3) Chloe with one of her young, #1054, his spinal cord severed.

#1054, intentionally crippled.

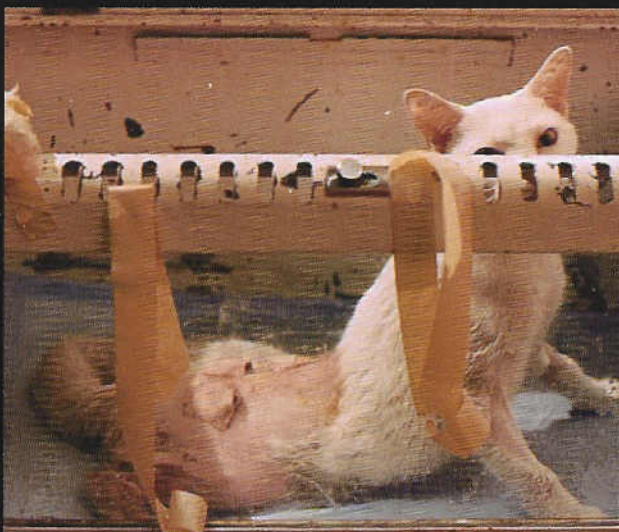

Snap and Pop, also crippled. Crackle, their sister, died from a "probable burst bladder" according to the researchers' records. (Spinal cord injuries usually stop natural urination.)

BROKEN PROMISES

to animals

Peaches, with back severed, electrodes in brain, and electrodes and wires embedded under the skin.

Dynamo, who had similar operations, cried out in distress. Both cats were left unattended overnight following these major surgeries.

BROKEN PROMISES *between* PEOPLE AND ANIMALS

There is a precious bond, a kinship between people and animals, which is being broken by the harmful medical fraud of vivisection.

We must stop breaking the bond; we must stop causing the suffering.

NO MORE BROKEN PROMISES!
